Re: (Systemwide Senate Review) Draft Presidential Unmanned Aircraft System (UAS) Policy

On behalf of the Committee on Instruction and Technology (CIT), I am writing to express faculty concerns regarding the proposed policy on unmanned aircraft systems (UAS) or ‘drones.’ The following issues were raised after soliciting responses from CIT committee members as well as from colleagues whom I know are currently using drones for university-related research purposes.

The main issue with the proposed policy concerns the need to obtain approval from a ‘designated authority’ before using a drone. Who exactly said authority is, and their respective qualifications, will certainly impact overall approval. How can a single authority be qualified to assess research programs that range from climate change to vegetation succession to the deterioration of urban infrastructure to drone choreography? Moreover, one of the key advantages of using drones in research is flexibility and rapid response. How long will approval take? What is the procedure for evaluation and what are the standards for approval?

The requirement to seek university approval beyond what is already mandated by local and federal regulations (e.g., registration, no fly zones) seems unnecessarily onerous, and may, in fact, slow research efforts. It is requested that alternative methods indemnify the University be sought.

Respectfully,

Michael Shin, Ph.D.
Committee on Instruction and Technology, Chair
Associate Professor of Geography
